

# Single chip 2.4 GHz Transceiver nRF24AP1 with Embedded ANT protocol

# **FEATURES**

- Integrated PAN (Personal Area Network)
- Drop in wireless networking with • simple serial interface
- 2.4GHz Worldwide ISM Band •
- Ultra-low power (coin cell battery) •
- Fully scaleable •
- Broadcast, Acknowledged or Burst • Data
- Message rates 0.5Hz -> 200Hz • (8byte data payload)
- Burst transfer rates up to 20kbps • (true data throughput)
- Public and private networks •
- 1 Mbps RF data rate
- 125 RF channels

# APPLICATIONS

- Sensor Networks
- Industrial Automation
- Home Automation
- Sports Monitoring

# **GENERAL DESCRIPTION**

The nRF24AP1 is an ultra-low power single-chip radio transceiver with embedded ANT protocol for personal area networks. The transceiver's RF operating frequency range falls within the world-wide 2.4 - 2.5 GHz RF ISM band, allowing for regulatory compliance and product sales into global markets.

# **QUICK REFERENCE DATA**

Parameter	Value	Unit
Minimum supply voltage	1.9	V
Maximum output power	0	dBm
Maximum data rate (over the air)	1000	kbps
Temperature range	-40 to +85	°C
Sensitivity	-80	dBm
Average current consumption as low as	30	μΑ
Peak current consumption TX @-5dBm	13.5mA for 350us	mA
Peak current consumption RX	22mA for 600us	mA
Max # of simultaneous connections <sup>1</sup>	>65000	connections
Max # of simultaneous independent 2-way connections	4	2-way connections
Maximum sustained transfer rate (all data – no overhead) <sup>2</sup>	20	kbps
CR2032 Battery life in a typical sensor application <sup>3</sup>	5	years

#### Table 1: nRF24AP1 quick reference data

Using Shared Channel Network

<sup>&</sup>lt;sup>2</sup> Transfer rate refers to data rate of the end application's message payload

<sup>&</sup>lt;sup>3</sup> Message interval of 2s, 1 hour/day usage

Nordic Semiconductor ASA - Vestre Rosten 81, N-7075 Tiller, Norway Phone +4772898900 Fax +4772898989 -Revision: 1.0 Page 1 of 25 September 2006

#### nRF24AP1 Single Chip 2.4 GHz Radio Transceiver with Embedded ANT Protocol

The transceiver consists of the ANT fully integrated protocol engine, frequency synthesizer, power amplifier, crystal oscillator and modulator, and can be interfaced to a host micro controller over either a synchronous or asynchronous serial interface. Designed to run on a wrist-watch coin cell battery, current consumption of the device is extremely low - a typical sensor application can operate on approximately 30µA average current consumption. Short, low peak current transitions are battery friendly.

The embedded ANT protocol makes for easy, low cost integration. Eliminating the need for  $3^{rd}$  party RF protocol implementation, the on-chip ANT protocol combined with the 2.4GHz transceiver enables system and application developers to interact with the nRF24AP1 as a black box wireless solution. The simple serial interface (asynchronous or synchronous) to the device allows for flexibility and scalability from ultra-low power sensors ( $30\mu A$ ) through to higher data rate (20kbps) applications implemented in a multitude of network configurations. Networks can be scaled from as little as two nodes to thousands. With  $2^{32}$  unique IDs, multiple radio frequencies, public and private network management and scalable data rates, an unlimited number of network configurations and applications are possible.

Prior to reading this document, the "ANT Message Protocol and Usage" document should be read to gain understanding of the ANT protocol capabilities.

# **Glossary of Terms**

Term	Description
Acknowledged Data	Data for which the transmitter receives an acknowledgement
C C	from the receiver
ANT	Ultra-low power embedded RF protocol
Broadcast Data	Default transmission type. Data sent on every time slot
Burst Data	Bulk data transmission between two nodes
Channel	Basic building block of ANT. Connects two devices together
Device ID	Device ID – Identifier for the master end of the channel
Device Number	Device Number is a subcomponent of Device ID, uniquely
	identifying this device
Device Type	Device Type is a subcomponent of Device ID, uniquely
51	identifying the type of this device
Forward Channel	Data transmission from Master to Slave on a channel
GFSK	Gaussian Frequency Shift Keying
HOST MCU	The MCU which interfaces and controls the nRF24AP1
ISM	Industrial-Scientific-Medical
ISM Band	Industrial, Scientific and Medical Band
Manufacturer ID	Manufacturer ID is a subcomponent of Device ID, uniquely
	identifying the manufacturer of this device
Master	Primary transmitter of the ANT network channel
MCU	Micro controller unit
Message Data rate	Number of messages per second sent over a channel
Message Payload	User portion of a data packet. Each data packet contains a
<i></i>	payload of 8 bytes.
Message	Data packet sent over a channel from one device to another
Networks	A group of ANT nodes connected together via channels
	forms a network in which the nodes may communicate with
	one another
Node	An application running on a host controller connected to an
	nRF24AP1, which communicates with other ANT nodes.
Pairing	The process in which a Slave obtains the Master's ID in order
-	to establish communications.
Reverse Channel	Data transmission from Slave to Master on a channel
RF data rate	The on air data rate. This rate is 1Mbps.
RF Frequency	RF Frequency used for communications. The nRF24AP1 can
	be configured to one of 125 different RF frequencies.
RX	Receive
Slave	Primary receiver of the ANT network channel
ТХ	Transmit

Nordic Semiconductor ASA - Vestre Rosten 81, N-7075 Tiller, Norway - Phone +4772898900 - Fax +4772898989 Page 11 of 25 Revision: 1.0 September 2006

nRF24AP1 Single Chip 2.4 GHz Radio Transceiver with Embedded ANT Protocol

# 8. ARCHITECTURAL OVERVIEW

The nRF24AP1 is a single-chip silicon solution that integrates a 2.4GHz transceiver and the ANT RF protocol stack. The ANT protocol stack is stored on-chip and is executed by the nRF24AP1's internal MCU core.

Functionally, the nRF24AP1 is composed of 4 main building blocks as shown in Figure 1. Together, the 4 blocks enable the drop-in RF and protocol solution. As shown, the 4 main blocks are the serial interface, the timing interface, the ANT protocol engine, and the RF transceiver. Both the ANT protocol engine and the RF transceiver are embedded within the device and interact with the external host environment through a UART or synchronous serial interface. This functional approach allows the nRF24AP1 to be treated as a black box wireless solution from the system application perspective. Integration of an RF protocol with the RF physical layer is not required. Application developers provides channel configuration and message data information to the device through the serial interface, and the nRF24AP1 executes the configuration and sends/receives the message data packets over the air to other waiting devices.

ANT is a 2.4GHz bidirectional wireless Personal Area Network (PAN) communications technology optimized for transferring low data-rate, low latency data between multiple ANT-enabled devices. The ultra-low power consumption of ANT guarantees an extended battery life even from low capacity supplies such as a coin cell battery, such as are required for heart rate monitors, bicycle computers, and wrist watches. The small size and low-cost implementation of ANT proves essential in allowing effortless integration into the tiny form factor of wrist watches, PDAs, and mobile phones.

The ANT – HOST interface has been designed with utmost simplicity in mind so that it can be easily and quickly implemented into new devices and applications. The encapsulation of the wireless protocol complexity within the ANT chipset vastly reduces the burden on the application host controller, allowing a low-cost 4-bit or 8-bit Microcontroller (MCU) to establish and maintain complex wireless networks with remote devices. Data transfers can be scheduled in a deterministic or ad-hoc fashion, and a burst mode allows for the efficient transfer of large amounts of stored data to and from a PC or other computing device. The ANT system aggressively balances functionality, cost, size, and power consumption within the constraints of a mobile Personal Area Network.

The ANT protocol implements layers 1-4 of the OSI networking stack as well as automatically providing session authentication of network devices. For description of layer 3 and 4, please refer to the "ANT Message Protocol and Usage" document.

# 9. ANT INTERFACE

# 9.1 Physical Layer – Serial Interfacing

The ANT serial interface between host controller and nRF24AP1 can be implemented over either a synchronous or asynchronous connection, which can be selected by the product developer as preferred for a given implementation. The precise details of the physical connections and signaling can be found in the 'Interfacing with ANT General Purpose Chipsets and Modules' document.

# 9.2 ANT Message Summary

The table in Section 9.4 summarizes the message types employed between the host controller and the nRF24AP1, which are used to establish and maintain RF connections to remote devices. Further details of the message fields and data contents can be found in the 'ANT Message Protocol and Usage' document.

# 9.3 32kHz Clock Signal (EXT32K)

A 32.768kHz clock signal may optionally be provided to the nRF24AP1. If this signal is not used, it must be connected to ground. Please see the electrical specification section for external clock specifications. Use of an external clock is recommended for power sensitive applications. The nRF24AP1 automatically detects the presence of an external clock source upon power up. In order to avoid timing issues between when the external clock source becomes present, and when the nRF24AP1 samples for this signal, it is recommended that a SystemReset (see Message Summary table below) command is issued to the nRF24AP1 upon initial connection. This will ensure that the external clock is properly detected and used. Once the EXT32K signal has been provided on power up it must remain present as long as the nRF24AP1 remains powered up.

#### 9.4 Message Summary

Class	Туре	ANT PC Interface Function	Response	From	Len	Msg ID	Data 1	Data 2	Data 3	Data 4	Data 5	Data 6	Data 7	Data 8	Data 9

Table 7: Application specific current consumption

Nordic Semiconductor ASA- Vestre Rosten 81, N-7075 Tiller, Norway- Phone +4772898900- Fax +4772898989Revision: 1.0Page 15 of 25September 2006

# **11. PERIPHERAL RF INFORMATION**

### 11.1 Antenna output

The ANT1 & ANT2 output pins provide a balanced RF output to the antenna. The pins must have a DC path to VDD, either via a RF choke or via the center point in a dipole antenna. A load of  $100\Omega$ +j175 $\Omega$  between the ANT1/ANT2 is recommended for maximum output power (0dBm). Lower load impedance (for instance 50  $\Omega$ ) can be obtained by fitting a simple matching network.

# 11.2 Output Power adjustment

RF output power	Peak current consumption
0 dBm ±3dB	16.0 mA
$-5 \text{ dBm} \pm 3 \text{ dB}$	13.5 mA
$-10 \text{ dBm} \pm 3 \text{dB}$	12.5 mA
-20 dBm ±3dB	12 mA

Conditions: VDD = 3.0V, VSS = 0V,  $T_A = 27^{\circ}C$ , Load impedance =  $100\Omega + j175\Omega$ .

Table 8: RF output power setting for the nRF24AP1

# 11.3 Crystal Specification

Tolerance includes initially accuracy and tolerance over temperature and aging.

Frequency	CL	ESR	C <sub>0max</sub>	Tolerance
16	12pF	100 Ω	7.0pF	±50ppm

Table 9: Crystal specification of the nRF24AP1

To achieve a crystal oscillator solution with low power consumption and fast start-up time, it is recommended to specify the crystal with a low value of crystal load capacitance. Specifying  $C_L$ =12pF is OK, but it is possible to use up to 16pF. Specifying a lower value of crystal parallel equivalent capacitance,  $C_0$  will also work, but this can increase the price of the crystal itself. Typically  $C_0$ =1.5pF at a crystal specified for  $C_{0max}$ =7.0pF.

# 11.4 Sharing crystal with micro controller

When using a micro controller to drive the crystal reference input XC1 of the nRF24AP1 transceiver some rules must be followed.

# 11.5 Crystal parameters:

When the micro controller drives the nRF24AP1 clock input, the requirement of load capacitance  $C_L$  is set by the micro controller only. The frequency accuracy of ±50 ppm is still required to get a functional radio link. The nRF24AP1 will load the crystal by 0.5pF at XC1 in addition to the PBC routing.

# 11.6 Input crystal amplitude & Current consumption

The input signal should not have amplitudes exceeding any rail voltage, but any DC-voltage within this is OK. Exceeding rail voltage will excite the ESD structure and the radio performance is degraded below specification. If testing the nRF24AP1 with a RF source with no DC offset as the reference source, the input signal will go below the ground level, which is not acceptable.

Figure 4: Principle of crystal oscillator

It is recommended to use a DC-block before the XC1 pin so that the internal ESD structures will self bias the XC1 voltage.

The nRF24AP1 crystal oscillator is amplitude regulated. To achieve low current consumption and also good signal-to-noise ratio, it is recommended to use an input signal larger than 0.4 V-peak. The needed input swing is independent of the crystal frequency. When clocking the nRF24AP1 externally, XC2 is not used and can be left as an open pin.

Nordic Semiconductor ASA- Vestre Rosten 81, N-7075 Tiller, Norway- Phone +4772898900- Fax +4772898989Revision: 1.0Page 17 of 25September 2006

# 11.7 PCB layout and de-coupling guidelines

A well-designed PCB is necessary to achieve good RF performance. Keep in mind that a poor layout may lead to loss of performance, or even functionality, if due care is not taken. A fully qualified RF-layout for the nRF24AP1 and its surrounding components, including matching networks, can be downloaded from **www.nordicsemi.no**.

A PCB with a minimum of two layers including a ground plane is recommended for optimum performance. The nRF24AP1 DC supply voltage should be de-coupled as close as possible to the VDD pins with high performance RF capacitors, see Table 10. It is preferable to mount a large surface mount capacitor (e.g.  $4.7\mu$ F tantalum) in parallel with the smaller value capacitors. The nRF24AP1 supply voltage should be filtered and routed separately from the supply voltages of any digital circuitry.

Long power supply lines on the PCB should be avoided. All device grounds, VDD connections and VDD bypass capacitors must be connected as close as possible to the nRF24AP1 IC. For a PCB with a topside RF ground plane, the VSS pins should be connected directly to the ground plane. For a PCB with a bottom ground plane, the best technique is to have via holes as close as possible to the VSS pads. One via hole should be used for each VSS pin.

Full swing digital data or control signals should not be routed close to the crystal or the power supply lines.

### 11.8 **Reflow information**

Figure 5 Reflow Soldering profile, GREEN

Ramp rate (RT-150°C)	1.38 °C/s
Pre-heat (150-200°C)	134 s
Dwell @217°C	50 s
Dwell @245°C	10 s
Ramp up	1.42 °C/s
Ramp down	2.59 °C/s
Peak temperature	257 °C
Time from RT to PT	320 s

nRF24AP1 Single Chip 2.4 GHz Radio Transceiver with Embedded ANT Protocol

#### **12.2 PCB layout example**

Figure 7 shows a PCB layout example for the application schematic in Figure 6.

A double-sided FR-4 board of 1.6mm thickness is used. This PCB has a ground plane on the bottom layer. Additionally, there are ground areas on the component side of the board to ensure sufficient grounding of critical components. A large number of via holes connect the top layer ground areas to the bottom layer ground plane.

No components in bottom layer

# **13. DEFINITIONS**

Data sheet status		
Objective product specification	This data sheet contains target specifications for product development.	
Preliminary product	This data sheet contains preliminary data; supplementary data may be	
specification	published from Nordic Semiconductor ASA later.	
Product specification	This data sheet contains final product specifications. Nordic Semiconductor	
	ASA reserves the right to make changes at any time without notice in order to	
	improve design and supply the best possible product.	
Limiting values		
Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Specifications sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.		
Application information		
Where application information is given, it is advisory and does not form part of the specification.		

Table 11: Definitions

Nordic Semiconductor ASA reserves the right to make changes without further notice to the product to improve reliability, function or design. Nordic Semiconductor ASA does not assume any liability arising out of the application or use of any product or circuits described herein.

# LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Nordic Semiconductor ASA customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Nordic Semiconductor ASA for any damages resulting from such improper use or sale.
